Worksheet 5

1.

Tugas:

- Buatlah program untuk menyelesaikan problem closest pair of points menggunakan algoritma divide & conquer yang diberikan. Gunakan bahasa C++
- 2) Tentukan rekurensi dari algoritma tersebut, dan selesaikan rekurensinya menggunakan metode recursion tree untuk membuktikan bahwa algoritma tersebut memiliki Big-O (n lg n)

a.

Sourch code:

```
// A divide and conquer program in C++
// to find the smallest distance from a
// given set of points.

#include <bits/stdc++.h>
using namespace std;

// A structure to represent a Point in 2D plane
class Point
{
    public:
    int x, y;
};
```

```
/* Following two functions are needed for library function qsort().
Refer: http://www.cplusplus.com/reference/clibrary/cstdlib/qsort/ */
// Needed to sort array of points
// according to X coordinate
int compareX(const void* a, const void* b)
{
    Point *p1 = (Point *)a, *p2 = (Point *)b;
    return (p1->x - p2->x);
}
// Needed to sort array of points according to Y coordinate
int compareY(const void* a, const void* b)
    Point *p1 = (Point *)a, *p2 = (Point *)b;
   return (p1->y - p2->y);
}
// A utility function to find the
// distance between two points
float dist(Point p1, Point p2)
    return sqrt((p1.x - p2.x)*(p1.x - p2.x) +
                (p1.y - p2.y)*(p1.y - p2.y)
            );
}
// A Brute Force method to return the
// smallest distance between two points
// in P[] of size n
float bruteForce(Point P[], int n)
    float min = FLT MAX;
   for (int i = 0; i < n; ++i)
        for (int j = i+1; j < n; ++j)
            if (dist(P[i], P[j]) < min)</pre>
                min = dist(P[i], P[j]);
    return min;
}
// A utility function to find
// minimum of two float values
float min(float x, float y)
{
    return (x < y)? x : y;
```

```
}
// A utility function to find the
// distance beween the closest points of
// strip of given size. All points in
// strip[] are sorted accordint to
// y coordinate. They all have an upper
// bound on minimum distance as d.
// Note that this method seems to be
// a O(n^2) method, but it's a O(n)
// method as the inner loop runs at most 6 times
float stripClosest(Point strip[], int size, float d)
    float min = d; // Initialize the minimum distance as d
    qsort(strip, size, sizeof(Point), compareY);
   // Pick all points one by one and try the next points till the difference
   // between y coordinates is smaller than d.
   // This is a proven fact that this loop runs at most 6 times
   for (int i = 0; i < size; ++i)</pre>
        for (int j = i+1; j < size && (strip[j].y - strip[i].y) < min; ++j)
            if (dist(strip[i],strip[j]) < min)</pre>
                min = dist(strip[i], strip[j]);
   return min;
}
// A recursive function to find the
// smallest distance. The array P contains
// all points sorted according to x coordinate
float closestUtil(Point P[], int n)
    // If there are 2 or 3 points, then use brute force
    if (n <= 3)
        return bruteForce(P, n);
   // Find the middle point
    int mid = n/2;
    Point midPoint = P[mid];
   // Consider the vertical line passing
   // through the middle point calculate
    // the smallest distance dl on left
```

```
// of middle point and dr on right side
    float dl = closestUtil(P, mid);
    float dr = closestUtil(P + mid, n - mid);
    // Find the smaller of two distances
    float d = min(dl, dr);
    // Build an array strip[] that contains
    // points close (closer than d)
    // to the line passing through the middle point
    Point strip[n];
    int j = 0;
    for (int i = 0; i < n; i++)</pre>
        if (abs(P[i].x - midPoint.x) < d)</pre>
            strip[j] = P[i], j++;
    // Find the closest points in strip.
    // Return the minimum of d and closest
    // distance is strip[]
    return min(d, stripClosest(strip, j, d) );
}
// The main function that finds the smallest distance
// This method mainly uses closestUtil()
float closest(Point P[], int n)
    qsort(P, n, sizeof(Point), compareX);
    // Use recursive function closestUtil()
    // to find the smallest distance
    return closestUtil(P, n);
}
// Driver code
int main()
{
    Point P[] = \{\{2, 3\}, \{12, 30\}, \{40, 50\}, \{5, 1\}, \{12, 10\}, \{3, 4\}\};
    int n = sizeof(P) / sizeof(P[0]);
    cout << "The smallest distance is " << closest(P, n);</pre>
    return 0;
}
// This is code is contributed by rathbhupendra
```

Screenshot:

```

b. Kompleksitas Waktu

Biarkan kompleksitas waktu dari algoritma di atas menjadi T (n). Mari kita asumsikan bahwa kita menggunakan algoritma pengurutan O (nLogn). Algoritma di atas membagi semua titik dalam dua set dan secara rekursif memanggil dua set. Setelah membelah, ia menemukan strip dalam waktu O (n), mengurutkan strip dalam waktu O (nLogn) dan akhirnya menemukan titik terdekat dalam strip dalam waktu O (n). Jadi T (n) dapat dinyatakan sebagai berikut

```
\begin{split} T &(n) = 2T \; (n \; / \; 2) + O \; (n) + O \; (nLogn) + O \; (n) \\ T &(n) = 2T \; (n \; / \; 2) + O \; (nLogn) \\ T &(n) = T \; (n \; x \; Logn \; x \; Logn) \end{split}
```

Tugas:

2.

- Buatlah program untuk menyelesaikan problem fast multiplication menggunakan algoritma divide & conquer yang diberikan (Algoritma Karatsuba). Gunakan bahasa C++
- 2) Rekurensi dari algoritma tersebut adalah T(n) = 3T(n/2) + O(n), dan selesaikan rekurensinya menggunakan metode substitusi untuk membuktikan bahwa algoritma tersebut memiliki Big-O (n lg n)

a.

Sourch code:

```
// C++ implementation of Karatsuba algorithm for bit string multiplication.
#include<iostream>
#include<stdio.h>

using namespace std;

// FOLLOWING TWO FUNCTIONS ARE COPIED FROM http://goo.gl/q00hZ

// Helper method: given two unequal sized bit strings, converts them to

// same length by adding leading 0s in the smaller string. Returns the

// the new length
int makeEqualLength(string &str1, string &str2)
{
    int len1 = str1.size();
    int len2 = str2.size();
    if (len1 < len2)
    {
        for (int i = 0 ; i < len2 - len1 ; i++)</pre>
```

```
str1 = '0' + str1;
        return len2;
    else if (len1 > len2)
       for (int i = 0 ; i < len1 - len2 ; i++)</pre>
            str2 = '0' + str2;
    return len1; // If len1 >= len2
}
// The main function that adds two bit sequences and returns the addition
string addBitStrings( string first, string second )
    string result; // To store the sum bits
   // make the Lengths same before adding
    int length = makeEqualLength(first, second);
    int carry = 0; // Initialize carry
   // Add all bits one by one
    for (int i = length-1; i >= 0; i--)
        int firstBit = first.at(i) - '0';
        int secondBit = second.at(i) - '0';
        // boolean expression for sum of 3 bits
        int sum = (firstBit ^ secondBit ^ carry)+'0';
        result = (char)sum + result;
        // boolean expression for 3-bit addition
        carry = (firstBit&secondBit) | (secondBit&carry) | (firstBit&carry);
    }
   // if overflow, then add a leading 1
    if (carry) result = '1' + result;
   return result;
}
// A utility function to multiply single bits of strings a and b
int multiplyiSingleBit(string a, string b)
{ return (a[0] - '0')*(b[0] - '0'); }
```

```
// The main function that multiplies two bit strings X and Y and returns
// result as long integer
long int multiply(string X, string Y)
    // Find the maximum of lengths of x and Y and make length
    // of smaller string same as that of larger string
    int n = makeEqualLength(X, Y);
   // Base cases
    if (n == 0) return 0;
    if (n == 1) return multiplyiSingleBit(X, Y);
    int fh = n/2; // First half of string, floor(n/2)
    int sh = (n-fh); // Second half of string, ceil(n/2)
    // Find the first half and second half of first string.
    // Refer http://goo.gl/lLmgn for substr method
    string Xl = X.substr(0, fh);
    string Xr = X.substr(fh, sh);
    // Find the first half and second half of second string
    string Yl = Y.substr(0, fh);
    string Yr = Y.substr(fh, sh);
    // Recursively calculate the three products of inputs of size n/2
    long int P1 = multiply(X1, Y1);
    long int P2 = multiply(Xr, Yr);
    long int P3 = multiply(addBitStrings(X1, Xr), addBitStrings(Y1, Yr));
   // Combine the three products to get the final result.
    return P1*(1<<(2*sh)) + (P3 - P1 - P2)*(1<<sh) + P2;
}
// Driver program to test above functions
int main()
{
    printf ("%ld\n", multiply("1100", "1010"));
   printf ("%ld\n", multiply("110", "1010"));
    printf ("%ld\n", multiply("11", "1010"));
    printf ("%ld\n", multiply("1", "1010"));
    printf ("%ld\n", multiply("0", "1010"));

b.

- Let's try divide and conquer.
 - Divide each number into two halves.

•
$$x = x_H r^{n/2} + x_L$$

• $y = y_H r^{n/2} + y_L$
- Then:
 $xy = (x_H r^{n/2} + x_L) y_H r^{n/2} + y_L$
 $= x_H y_H r^n + (x_H y_L + x_L y_H) r^{n/2} + x_L y_L$
- Runtime?

- Runtime?
 - T(n) = 4 T(n/2) + O(n)
 - $T(n) = O(n^2)$
- Instead of 4 subproblems, we only need 3 (with the help of clever insight).
- Three subproblems:

$$- a = x_H y_H$$

 $- d = x_L y_L$
 $- e = (x_H + x_L) (y_H + y_L) - a - d$

- Then xy = $a r^n + e r^{n/2} + d$
- T(n) = 3 T(n/2) + O(n)
- $T(n) = O(n^{\log 3}) = O(n^{1.584...})$

3.

Tugas:

- Buatlah program untuk menyelesaikan problem tilling menggunakan algoritma divide & conquer yang diberikan. Gunakan bahasa C++
- 2) Relasi rekurensi untuk algoritma rekursif di atas dapat ditulis seperti di bawah ini. C adalah konstanta. T(n) = 4T(n/2) + C. Selesaikan rekurensi tersebut dengan Metode Master

a.

Sourch code:

Screenshot:

b. Kompleksitas Waktu:

Relasi perulangan untuk algoritma rekursif di atas dapat ditulis seperti di bawah ini. C adalah konstanta.

$$T(n) = 4T(n/2) + C$$

Rekursi di atas dapat diselesaikan dengan menggunakan Metode Master dan kompleksitas waktu adalah O (n2)

Bagaimana cara kerjanya?

Pengerjaan algoritma Divide and Conquer dapat dibuktikan menggunakan Mathematical Induction. Biarkan kuadrat input berukuran $2k \times 2k$ di mana k > 1.

Kasus Dasar: Kita tahu bahwa masalahnya dapat diselesaikan untuk k = 1. Kami memiliki 2 x 2 persegi dengan satu sel hilang.

Hipotesis Induksi: Biarkan masalah dapat diselesaikan untuk k-1.

Sekarang perlu dibuktikan untuk membuktikan bahwa masalah dapat diselesaikan untuk k jika dapat diselesaikan untuk k-1. Untuk k, ditempatkan ubin berbentuk L di tengah dan memiliki empat subsqure dengan dimensi 2k-1 x 2k-1 seperti yang ditunjukkan pada gambar 2 di atas. Jadi jika dapat menyelesaikan 4 subskuares, dapat menyelesaikan kuadrat lengkap.
